

NEW YORK

NYC's supertall skyscraper boom, mapped

These 20+ skyscrapers will forever alter the New York City skyline

By **CurbedStaff** | Jan 22, 2018, 10:00am EST

Max Touhey

When it comes to new developments in New York City, the supertall tower is clearly king: many of the city's most high-profile developments, from [One World Trade Center](#) to Central Park Tower, all exceed the 984-foot limit that [takes a building](#) from merely tall to supertall. (Alas, architects here have yet to design a building that would rocket into the megatall—above 1,968 feet—category.)

These soaring towers aren't always popular—many have actively [fought against](#) the buildings sprouting along 57th Street and Central Park South, worried that they'll cause shadowing over the storied park—but it's hard to argue against their status as [marvels of engineering](#). But how many of these buildings does New York City have? We counted, and the number as of right now is 24; that includes buildings that are either completed, under construction, or in the proposal or development phases. They're all mapped below—and if you know of something new, hit the [tipline](#).

11 45 Broad Street: 1,115 feet

Status: Under construction

Construction is [officially underway](#) on what will become the Financial District's tallest residential tower, standing more than 1,110 feet tall with 206 condos that come in studio through three-bedroom variants (including penthouses). Prices will start at just under \$1 million and go up to \$6 million.
